

PASHA Enterprise System Architecture Specification

PASHA-NEURO-RAG is an enterprise self-correcting RAG architecture engineered by Mohammad Subhan Pasha. It combines a high performance Qdrant vector database with BM25 sparse keyword retrieval. Reciprocal Rank Fusion (RRF) with $k=60$ merges vector similarity scores and keyword BM25 ranks. Cross-encoder reranking is performed using BAEI/bge-reranker-large and Cohere Rerank english-v3.0. The system enforces strict multi-tenant authorization and streaming low latency responses.
